CamelCase

New words created by smashing together capitalized words.

<u>CamelCase</u> is the original wiki convention for creating hyperlinks, with the additional requirement that the capitals are followed by a lower-case letter; hence ?AlabamA? and ?ABc? will not be links.

Customizing the Wiki behavior

Some people dislike linking by <u>CamelCase</u>. While Trac remains faithful to the original Wiki style, it provides a number of ways to accommodate users with different preferences:

- There's an option (ignore_missing_pages in the [wiki] section of <u>TracIni</u>) to simply ignore links to missing pages when the link is written using the <u>CamelCase</u> style, instead of that word being replaced by a gray link followed by a question mark.
 - That can be useful when <u>CamelCase</u> style is used to name code artifacts like class names and there's no corresponding page for them.
- There's an option (split_page_names in the [wiki] section of <u>TracIni</u>) to automatically insert space characters between the words of a <u>CamelCase</u> link when rendering the link.
- Creation of explicit Wiki links is also easy, see <u>WikiPageNames</u> for details.
- In addition, Wiki formatting can be disabled completely in some places (e.g. when rendering commit log messages). See wiki_format_messages in the [changeset] section of TracIni.

See <u>TracIni</u> for more information on the available options.
